

TRANSPARENCY & ACCOUNTABILITY

Quinhão

The share that is owed to someone by right.

Mozambican law sends **2.75%** of the mining and petroleum production tax to the communities that host the extraction. This shows where it went — and what nobody can explain.

THE PROBLEM

The money arrives. The explanation does not.

“the budget execution report does not allow us to determine what criterion was used to split the amount allocated to each community, nor what activities the funds went to”

EITI Mozambique — the official transparency body — in its 2020 and 2021 reports

This is not an accusation from outside. It is the state's own transparency mechanism reporting that it cannot answer the question.

THE FINDING · 2024

Communities get a third of what the provincial offices get.

Affected communities

318.7M MZN

Provincial directorates

840.3M MZN

The people living on top of the ruby, the coal and the gas receive 4.99 million dollars. The provincial capitals receive 13.15 million.

AND THE ARITHMETIC DOES NOT CLOSE

12.79 million meticaïs unaccounted for — admitted in the report itself.

Mining production tax, 2018	3,029.90
Petroleum production tax, 2018	627.80
Total	3,657.70
2.75% of that should be	100.59
Actually allocated	87.80
Difference	12.79

The Ministry's explanation: only the *mining* tax counts, not the petroleum one. The law says both.

WHO THIS IS FOR

56 localities. The people who live in them.

Residents

Nyamanhumbir, Benga, Topuito, Pande and 52 more. They can see what was booked in their name, and who is answerable for it.

Local councils

Locality Consultative Councils approve the projects. They rarely have the allocation figures in front of them.

Journalists & civil society

CIP and others analyse the 2.75% today by reading PDFs. This makes six years queryable.

The design assumes a basic phone on a weak connection, varied literacy, and Portuguese — not a laptop in Maputo.

One page. Your locality, and who is answerable for it.

Where the 2.75% lands • 2024

Districts. Grey received nothing.

Transferred to this locality: Benga

Moatize • Tete • Carvão Mineral

40.7 million MZN over 6 years

What you can do with this. The District Secretariat and the Locality Consultative Council are answerable. The law limits spending to education, health, agriculture and forestry. Three questions you have the right to ask.

WHY THE NUMBERS CAN BE TRUSTED

The build fails rather than publish a wrong figure.

- Nothing typed by hand — five source PDFs parsed by script
- Every year's total asserted against the published total
- An unmatched district name fails the build instead of vanishing from the map
- Manual corrections listed explicitly, with reasons
- Currency converted at each year's own official rate

What the data cannot show

Execution is reported at ~100%. That means the money left the treasury — not that anything was built. The page says so, in the same type size as the good news.

HOW AI CODING TOOLS WERE USED

The most useful thing it did was kill the first idea.

- **Tested the premise.** The original concept was "allocated vs. actually transferred". The annexes show 100% execution everywhere — that story did not exist.
- **PDF archaeology.** Found the transfer tables across five reports in three different layouts, including project-level spending nobody had extracted.
- **Parsers written against a hard check,** corrected until all five totals matched.
- **Verified rather than assumed.** Checked data availability before committing — the national procurement portal was returning a database error, which is why this uses EITI data. Rejected an offered photograph showing a rig type Mozambique does not have.

SCALE

The format is the same in 50+ countries.

EITI reporting is standardised. The parsing approach, the verification gate and the page all port to any implementing country that publishes subnational transfers — Ghana, Nigeria, Tanzania, the DRC.

Inside Mozambique the next layer is field verification: the page already ends by telling a resident who is answerable and what to ask. Collecting their answers turns 56 localities into a monitoring network.

Cost to run: zero. A static page and a script that re-runs when the next EITI report is published.

QUINHÃO

Nobody in Nyamanhumbir was told that 21.1 million meticaïs was booked in their name.

Now they can check — and know who to ask.
